Information security is one of the basic pillars used to provide information in a secure and fair manner. It provides the necessary protection for information, processes and key structures by preventing any attempt to penetrate or threaten this information. Information security is based on the principle of not allowing all people access to all levels, as the process of entry is based on the authentication granted to individuals. The process of maintaining information security is based on controlling the way the user accesses the information by verifying his/her identity using a particular method in order to identify the person. These methods include a range of situations such as verifying something owned by the individual or something known about him/her.
